1. Dataset Overview

- **Total Respondents:** 630 professionals, **Interest in Career Switch:** 59% (372 individuals), **Not Interested in Switching:** 41% (258 individuals)
 - **Gender Split (Male:** 74% (468) and **Female:** 26% (162)):
- This imbalance suggests a possible skew in gender representation, which might influence trends like salary expectations or work-life balance.

2. Key Professional Insights

Yearly Income Distribution: (Entry Level: 424 (67%) – dominant income tier, **Mid Level:** 145, **Senior Level:** 46, **Expert:** 13 and **Executive:** 2)

Insight: The dataset is heavily skewed towards early-career professionals. This implies limited insight into senior-level trends but provides rich data for graduate hiring and early development programs.

Most in Demand skills: The most dominant job is the category of data professionals (data analysis, data science, etc.) signifying a very high demand for those specific jobs in the data world. Most respondents chose python as their favourite programming language skill which is mostly likely due to the high demand for such skill in the labour market.

3. Education Level vs Workforce Composition

- **Most common education level:** Bachelor’s degree, **Next highest:** High School, followed by Masters.

Insight: Bachelor’s degree holders dominate the workforce. Companies targeting hiring and upskilling initiatives might focus training support or talent pipelines at this level.

4. Salary Satisfaction and Work Balance

- **Average Salary Satisfaction Rating:** 4.27/10, **Average Work/Life Balance Rating:** 5.74/10, **Average Management Satisfaction Rating:** 5.33/10

Insight: There is **moderate dissatisfaction** across key employee experience areas, particularly with salary. This aligns with high career-switch interest and expectations for better pay.

5. Expectations From a New Job

Top motivators for switching jobs:

- **Better Salary (47%), Good Work Culture (19%), Remote Work (10%)**

Insight: Compensation and company culture are primary drivers in career decisions. Employers must improve these to retain talent.

6. Age Group Distribution

- **Adult (26–39):** 388, **Young Adult (18–25):** 189, **Middle-aged (40–59):** 51, **Senior (60+):** 2

Insight: The survey captures **primarily early-career to mid-career professionals**, making it highly relevant for junior recruitment and early-career mentoring strategies.

7. Geographic Insights

- Majority of the respondents span **Europe and North America**, while few others are in some areas in **Africa/Asia**.

Insight: The results reflect **global but Western-heavy trends**. HR policies based on this might need regional adaptation.

8. Difficulty Navigating the Data World

- **43% found it “Difficult”** to break into the data world while 25% found it **“Very Difficult”**. Only 7% found it “Easy” or “Very Easy”

Insight: There is a **clear skill gap in data literacy**. This could guide **corporate training programs** or **career development services** toward upskilling in data fluency.

Cleaning & Transformation Decisions

- Removed irrelevant columns
- Standardized categories for job roles column. The raw job role column contained inconsistent entries, such as long sentence responses and options like “Other (Please Specify): Data Analyst.” We extracted relevant roles and grouped similar responses under consistent categories (e.g., Analyst, Data Analyst, Developer)
- Handled open-ended and incomplete responses. For columns like *Favourite Programming Language* and *Job Role*, where responses were highly varied, Power Query’s ‘Text.Contains’ function was used to assign known values (e.g., “Python”, “SQL”) and labeled everything else as “None” or “Unknown” to avoid data loss.
- Created new groupings. calculated column was created using DAX to group respondents into “Young Adult”, “Adult”, and “Senior” based on their age. Salary Band Categorization: Predefined salary bands were used to group responses in a consistent and analyzable format.
- Extracted and sort date elements. Day names from the date column were extracted using DAX and used an additional column with weekday numbers to ensure correct chronological sorting in slicers and visuals.
- Preserved data integrity. Nulls or blanks were preserved where possible to retain entries for other relevant columns, instead labelled unknowns appropriately to reduce data bias.
- Improved visual clarity. In preparation for dashboard building, columns were renamed for readability, unnecessary fields were removed, and values were reformatted.
- New measures were created for easier and smoother analysis to produce very highly interactive dashboard
- Drill through feature was used to aid easy interaction with dashboard and quick access to relevant information

Implications for Stakeholders

- **For HR:** Revamp retention strategies by focusing on salary competitiveness and cultural improvements.
- **For Career Advisors:** Focus support on entry-level job seekers and promote data literacy training.
- **For Business Leaders:** Invest in leadership development and early-career support programs to build loyalty and grow future leaders.

Report by Aishat Omolabake Ajibola

Gender	Age Group	Current job role (groups)	Specific Current Job Role	Highest Education level	Industry	Yearly Salary Group	Country	Career switch to data	Difficulty breaking into data	Favourite Programming Language	Ethnicity	Expectation from new role
Male	Adult	Data Professionals	Data Analyst	Bachelors	Advertising	Entry Level	United States	Yes	Very Difficult	R	Asian or Asian American	Better Salary
Male	Young Adult	Analysts	Research Analyst	Bachelors	Advertising	Entry Level	Canada	Yes	Neither easy nor difficult	R	Asian or Asian American	Better Salary
Male	Adult	Data Professionals	Data Analyst	Bachelors	Aerospace	Mid Level	United States	Yes	Easy	Python	Hispanic or Latino	Better Salary
Female	Young Adult	Data Professionals	Data Analyst	Masters	Agriculture	Entry Level	United States	No	Neither	SQL	Asian or Asian	Better Salary
