Healthcare Dashboard Report

Key Insights

1. Patient Trends

- The majority of patients were **adults and elderly patients (senior)**, with few young adults
- **Male patients** slightly outnumbered females.
- Over **80%** of the patients have long length of stay
- The most common **primary diagnosis** was related to chronic conditions, especially those with **multiple comorbidities**.
- Patients with **more comorbidities (2 or more)** tended to have a **longer average Length of Stay (LOS)**.

2. Treatment Effectiveness

- **About 50% of the patients do not adhere to medication**, suggesting the need for healthcare professionals to ensure patients follow-through on prescriptions.
- The average rate of level care satisfaction is 3.0/5.0, suggesting that the patients are receiving moderate to slightly high level of treatments with positive responses.

3. Cost/Resource Analysis (LOS as a proxy)

- The **average LOS** across all patients was 16 days.
- Patients with **3+ comorbidities** contributed most to increased hospital resource use, as seen in extended LOS.

4. Department Performance

- The departments tend to be performing almost at the same rate, though the department that treats injuries has the highest number of patients
- All department except the one that treat infections have patients with the same average length of stay
- Departments with high follow-up appointments correlated with **better satisfaction scores** and **medication adherence**.

Design Choices

- A clean, **one-page interactive dashboard** layout with:
 - **KPI Cards** for core metrics (Avg LOS, Average rate of satisfaction and number of patients)
 - **Pie charts and bar graphs** for demographic breakdowns
 - **Slicers** for filtering by gender, LOS and age group
 - A **"Clear Filters" button** added for a smooth user experience
 - Applied **consistent color themes** and iconography for ease of interpretation

Challenges Faced & Solutions Applied

Dataset had **coded comorbidities (0–3)** without description - Created a **calculated column** to label them as "None", "Single", "Double", "Multiple"

Needed to add **age categories** - Used a **calculated column** in Power BI to group ages into: "Child", "Teen", "Young Adult", "Adult", and "Senior"

Pie chart not rendering - Discovered that **no value field** was added — corrected by assigning a value to the chart

Clear Filter button not working _ Reconfigured the **Bookmark action** properly and ensured all slicers were selected before saving the bookmark

Added a **Text Box** and created a new **"Insights" page** summarizing key findings

Final Notes

This Power BI dashboard is designed to assist healthcare managers in identifying **patient care gaps, optimizing treatment protocols**, and **allocating resources** effectively. Insights from comorbidities, satisfaction ratings, and LOS help guide better strategic decisions across departments.
